Alexandria Larson

Central Everglades Planning Project
Configuration Summary Sheet

Configuration Name: Establish a Unique and Descriptive Name of the Proposed Configuration.

Human & Equine Residue at its Finest

Author of the Configuration: Identify the name of the Author that developed the Configuration during the exercise.

Alex Larson

Configuration's General Description: This description should be able to convey the general aspects, elements, and general location of management measures in this configuration.

We are not doing what we should. Making Big Sugar clean up its mess.

Lake Okeechobee is Northern Florida's personal toilet.

Management Measures: List the management measures used in the configuration (Deep Storage, Shallow Storage, STA, Restored Wetland, ASR).

STA's & ASR do - not work.

How Water Flows Through the Configuration: This description should identify the travel route of the water that the configuration will be managing. Identify where the water is coming from and where it goes. The Author should be able to generally describe how the water gets from the originating water source (for example, Lake Okeechobee) to the final destination of the water.

Central Florida flushes it's waste South to Lake Okeechobee and then the ACOE flushes it East West & South. Big Sugar adds to the mess and it is pushed South

Objectives: Identify and prioritize (rank) the specific CEPP Objectives that the configuration is intended to meet (use the list of Objectives as needed).

Nothing! Until we clean up Lake Okeechobee & Big Sugar we continue to poison the Everglades

Anticipated Benefits General Description: Identify why the Author chose the features in the configuration. List, prioritize and provide a general description of any benefits anticipated from the Proposed Configuration.

This is a waste of time. It is putting a Bandage on a Shot Gun Wound.

Operating Assumptions General Description: List anything specifically that the Author wants relative to the operation of the configuration. Examples might be operational changes within the confines of the LO Schedule to maximize improvements to water supply or the environment, or both; specific high and low levels for Lake Okeechobee; maximize pulse discharges or modify timing to natural system; manage project features wet or dry.

Stop draining & mitigating all of our wetlands. We continue to enable the destruction of the Everglades facilitating builders. Stop that.

Other Key Elements: List the main Considerations that have not been mentioned elsewhere on this Form. Examples may include Water Supply in the Lake Okeechobee Service Area; deliver all available water to Florida Bay; Recreational Opportunities; etc.

We continue to ingnore the guilty parties who poison Florida on a daily basis. Shame on SFWMD & the ACOE for trying to help building.
