

WORKING DRAFT 12-06-00

SOUTH FLORIDA ECOSYSTEM RESTORATION

TASK FORCE

Biennial Report

FY 1999 – 2000

Letter from the Task Force Chair

**SOUTH FLORIDA ECOSYSTEM RESTORATION TASK FORCE MEMBERS
FY 1999 – 2000**

Clarence Anthony

Mayor, City of South Bay

Michael Collins

Chairman, South Florida Water Management
District Governing Board

Michael L. Davis

Deputy Assistant Secretary for Civil Works,
Department of the Army

J. Allison DeFoor, II

State of Florida Environmental Policy
Coordinator

Mary Doyle

Acting Assistant Secretary for Water and
Science, U.S. Department of the Interior

Jonathan Charles Fox

Assistant Administrator for Water, U.S.
Environmental Protection Agency

Glenda Humiston

Deputy Under Secretary for Natural Resources,
U.S. Department of Agriculture

Dexter Lehtinen

Special Assistant for Everglades Issues to the
Miccosukee Tribe of Indians of Florida

Lois Schiffer

Assistant Attorney General for Environment and
Natural Resources, U.S. Department of Justice

Jim Shore

General Counsel to the Seminole Tribe of
Florida

David B. Struhs

Secretary, Florida Department of Environmental
Protection

Sally J. Yozell

Deputy Assistant Secretary, National Oceanic
and Atmospheric Administration

Terrence "Rock" Salt

Executive Director, South Florida Ecosystem
Restoration Task Force

Vacant

State of Florida Representative

Vacant

U.S. Department of Transportation
Representative

REPORT PURPOSE AND BACKGROUND

Purpose

This *Biennial Report* summarizes the progress made in fiscal year 1999 and fiscal year 2000 to restore the South Florida ecosystem. The report describes only the highlights of the task force member agencies' activities. The entirety of the effort includes over 200 projects underway by federal, state, tribal, regional, and local agencies and organizations to address critical issues related to water quantity and quality, natural habitats and species, and the compatibility of the built and natural systems in South Florida.

The report is illustrative, not all-inclusive. Instead, this report illustrates the kinds of actions taking place and the types and nature of the most recent accomplishments. Annual reports produced by participating agencies, such as the South Florida Water Management District (SFWMD), provide details about individual projects. *This report paints the big picture.*

This report is intended for four principal audiences, the

United States Congress
Florida Legislature
Seminole Tribe of Florida
Miccosukee Tribe of Indians of Florida

The information included here will also be broadly shared with state and federal agencies, local governments, regional agencies and industries, private interest groups, and private citizens interested in South Florida ecosystem restoration.

This report is intended to demonstrate *qualitatively* to the above authorities and other interested parties that progress is being made and that funds targeted for restoration are being spent in logical and accountable ways. Subsequent biennial reports will contain *quantitative* information of progress toward meeting restoration goals (see discussion in the "Accomplishments" section on the *Strategy for Restoration of the South Florida Ecosystem*).

Authority

The 1996 Water Resources Development Act (WRDA 1996) charged the U.S. Army Corps of Engineers (Corps of Engineers) to develop a comprehensive plan for restoring the hydrology of South Florida (the Central and Southern Florida Project restudy) and established a 50 percent federal cost-share for implementing the plan.

WRDA 1996 also formally established a South Florida Ecosystem Restoration Task Force (task force), comprised of federal, state, tribal, regional, and local governments, to coordinate ecosystem restoration efforts in South Florida. The task force had begun in 1993 as a federal interagency partnership, with informal participation by the State of Florida, the Seminole

Tribe of Florida, and the Miccosukee Tribe of Indians of Florida. WRDA 1996 authorized the operation of the task force and provided for specific membership and duties. Pursuant to its statutory duties, the task force works to resolve conflicts among participants, coordinate research, assist participants, prepare an integrated financial plan, and report to Congress. The task force has no overriding authority to direct its members. Instead, the members are accountable individually to their appropriate authorities and to each other for the success of the restoration. Because on-the-ground restoration is accomplished through the efforts of the individual task force member agencies, they are the ones that are ultimately responsible for their particular programs, projects, and associated funding.

WRDA 1996 stipulated that every two years the task force would report on the following task force activities:

- policies, strategies, plans, programs, projects, activities, and priorities planned, developed, or implemented for South Florida ecosystem restoration
- progress made toward restoration

This is the second of the biennial reports required by the act.

The Imperiled South Florida Ecosystem

The South Florida ecosystem is an 18,000-square-mile region of subtropical uplands, wetlands, and coral reefs that extends from the Chain of Lakes south of Orlando through the reefs southwest of the Florida Keys. This ecosystem not only supports the economy and the quality of life of the Floridians and the Native American Indians who live there, but also enriches the legacy of all Americans. It encompasses many nationally significant conservation areas, including Everglades and Biscayne National Parks, Big Cypress National Preserve, the Arthur R. Marshall Loxahatchee National Wildlife Refuge, and the Florida Keys National Marine Sanctuary.

This ecosystem is sustained by water, and it has been seriously degraded by disruptions to the natural hydrology. Engineered flood control and water distribution systems for agriculture and urban development have dewatered large areas and greatly altered the quantity, timing, and distribution of water flows in other locations. Agricultural runoff and urban stormwater have introduced phosphorus and other contaminants into the water systems, polluting lakes, rivers, and wetlands. Discharges of stormwater into estuaries and coastal waters have severely degraded aquatic habitats. Groundwater is threatened by saltwater intrusion and other pollutants. These impacts have stressed the natural system, as evidenced by

- fifty percent reduction in the original extent of the Everglades, including important habitat and groundwater recharge areas
- ninety percent reductions in wading bird populations
- sixty-nine species on the federal endangered or threatened list
- declines in commercial fisheries in Biscayne and Florida Bays
- compaction of more than five feet of organic soil in the Everglades Agricultural Area
- fifty percent declines in the clarity of water in certain locations within the Florida Keys

- infestations of exotic plant species on over 1.5 million acres
- damaging freshwater releases into the St. Lucie and Caloosahatchee estuaries
- loss of 40,000 acres of grass beds in Lake Okeechobee
- loss of tree islands and damaging ecological effects in the water conservation areas
- nineteen percent decline in living corals in the last decade

Overview of Restoration Efforts

The best current estimate is that the restoration of the South Florida ecosystem will take 40-50 years and cost about \$14.8 billion. Of the total restoration cost, \$7.8 billion represents the cost of implementing the *Comprehensive Everglades Restoration Plan*, which will be shared equally by the federal government and nonfederal sponsors. CERP outlines 68 projects that will take more than 30 years to construct. CERP builds on other plans and projects that were authorized by Congress or the Florida Legislature prior to and independent of CERP. These include the Everglades Construction Project, the C-111 Project, the Modified Water Deliveries to Everglades National Park Project, the Kissimmee River Restoration Project, a number of smaller 'Critical Projects' authorized by WRDA 1996, the *South Florida Multi-Species Recovery Plan*, state water quality plans, state land acquisitions authorized for Save Our Rivers (SOR) and Conservation and Recreation Lands (CARL) programs, and federal land acquisitions for national parks, preserves, and wildlife refuges. Taken together, these projects represent an additional \$7 billion investment. Once the major projects are complete, additional time may be needed for the natural systems to reestablish the processes and structures of a healthy ecosystem.

The schedules and cost estimates for ecosystem restoration projects span multiple decades and depend upon certain assumptions about state and federal budget requests and funding levels, optimized construction schedules, willing sellers, and other contingencies. These assumptions are likely to change as the restoration effort progresses.

Milestones

- 1972 *Florida Water Resources Act* established fundamental water policy for Florida, attempting to meet human needs and sustain natural systems; put in place a comprehensive strategic program to preserve and restore the Everglades ecosystem.
- 1972 *Florida Land Conservation Act* authorized the issuance of bonds to purchase environmentally endangered and recreation lands.
- 1983 *Governor's Save Our Everglades Program* recognized that the entire ecosystem should be restored and protected; initiated Kissimmee River Restoration Project.
- 1984 *Florida Warren Henderson Act* authorized the Department of Environmental Regulation (now the Department of Environmental Protection) to protect the state's wetlands and surface waters for public interest.
- 1985 *Florida Local Government Comprehensive Planning and Land Development Regulation Act* required the development and coordination of local land use plans.
- 1987 *Compact amongst the Seminole Tribe of Florida, the State of Florida and the South Florida Water Management District* completed.
- 1987 *Florida Surface Water Improvement and Management Act* required the five Florida water management districts to develop plans to clean up and preserve Florida lakes, bays, estuaries, and rivers.
- 1988 *Land Settlement Act of 1987* transferred acreage in WCA3 and the Rotenberger Tract to the State of Florida for Everglades restoration.
- 1990 *Florida Preservation 2000 Act* established a coordinated land acquisition program to protect the integrity of ecological systems and to provide multiple benefits, including the preservation of fish and wildlife habitat, recreation space, and water recharge areas.
- 1990 *Florida Keys National Marine Sanctuary and Protection Act* established a 2,800 square-nautical-mile marine sanctuary and authorized a water quality protection program.
- 1991 *Florida Everglades Protection Act* provided the South Florida Water Management District with clear tools for ecosystem restoration.
- 1992 *Water Resources Development Act* authorized the Kissimmee River Restoration Project and the Central and Southern Florida Project Restudy.
- 1993 *Federal South Florida Ecosystem Restoration Task Force* established to coordinate ecosystem restoration efforts in South Florida.
- 1994 *Florida Everglades Forever Act* outlined a comprehensive plan to restore significant portions of the South Florida ecosystem through construction, research, and regulation.
- 1994 *Governor's Commission for a Sustainable South Florida* established to make recommendations for achieving a healthy South Florida ecosystem that can coexist with and mutually support a sustainable economy and quality communities.
- 1994 *Miccosukee Tribe* approved by EPA to establish water quality standards for reservation lands in accordance with Section 518 of the Clean Water Act.
- 1996 *Water Resources Development Act* authorized a comprehensive review study for restoring the hydrology of South Florida; expanded the South Florida Ecosystem Restoration Task Force to include tribal, state, and local governments, mandated extensive public involvement, and allowed the task force to address the full scope of restoration needs (natural and built).

- 1996 *Section 390 of the Farm Bill* directly appropriated \$200 million to conduct restoration activities in the Everglades ecosystem in South Florida.
- 1997 *Seminole Tribe of Florida's water quality standards* for the Big Cypress Reservation approved by USEPA.
- 1997 *Miccosukee Tribe water quality standards* established for tribal lands located in WCA-3A. Standards established 10 ppb criteria for total phosphorus in tribal waters.
- 1997 *1997, 1998, 1999, and 2000 Interior Appropriations Acts* provided for land acquisition by the National Park Service and the Fish and Wildlife Service in the Everglades ecosystem.
-
- 2000
- 1998 *Seminole Tribe of Florida's water quality standards* for the Brighton Reservation approved by the Environmental Protection Agency.
- 1999 *Comprehensive Everglades Restoration Plan* submitted to Congress, outlining 68 infrastructure projects to modify the current water delivery system and improve the quantity, quality, timing, and distribution of water to the natural system; estimated total cost of \$7.8 billion to be shared on a 50-50 basis by the federal and nonfederal sponsors.
- 1999 *Water Resources Development Act* extended Critical Restoration Project authority until 2003; authorized two pilot infrastructure projects proposed in the *Comprehensive Everglades Restoration Plan*.
- 1999 *Governor's Commission for the Everglades* appointed to advise the South Florida Ecosystem Restoration Task Force on issues relating to Everglades protection and restoration, environmental justice, and water resource protection, among other issues.
- 1999 *Miccosukee water quality standards* approved by the Environmental Protection Agency.
- 1999 *Miccosukee Reserved Area Act* directed Miccosukee Tribe to establish water quality standards for the Miccosukee Reserved Area (inflow points to Everglades National Park).
- 1999 *Miccosukee Tribe water quality standards* established for water passing through the Miccosukee Reserved Area, into Everglades National Park.
- 2000 *Florida Everglades Restoration Investment Act* created a funding and accountability plan to help implement the *Comprehensive Everglades Restoration Plan*. Two billion in state funding is committed to Everglades Restoration
- 2000 *Water Resources Development Act* included \$1.7 billion in authorizations for the first round of Everglades infrastructure projects and pilot projects, and granted programmatic authority for projects with immediate and substantial restoration benefits.

MAJOR ACCOMPLISHMENTS, FISCAL YEARS 1999-2000

An Articulated Strategy for Restoring the South Florida Ecosystem

In July 2000 the Department of the Interior submitted the task force's *Strategy for the Restoration of the South Florida Ecosystem* to Congress. The purpose of the strategy document was to describe the more than 200 federal, state, tribal, and local programs designed to restore and sustain the imperiled South Florida ecosystem and to provide the information needed to coordinate the restoration effort. The strategy responded to a need identified by the U.S. General Accounting Office (GAO) for an overall strategic plan for restoration and a decision-making process for resolving conflicts.

In devising their coordination strategy, the task force members

- agreed upon a vision of the results to be achieved and how those results would be measured in terms of ecosystem health
- established three broad goals and measurable objectives for the work they would need to accomplish to achieve their vision
- identified the projects needed to meet their work objectives
- created data bases to help coordinate and track projects and accomplishments
- adopted a protocol to facilitate the resolution of issues and conflicts

TASK FORCE VISION

A healthy South Florida Ecosystem that supports diverse and sustainable communities of plants, animals, and people

TASK FORCE WORK GOALS

Goal 1: Get the water right, which means restoring natural hydrologic functions and water quality in wetland, estuarine, marine, and groundwater systems, while also providing for the water resource needs of urban and agricultural landscapes.

Goal 2: Restore, preserve, and protect natural habitats and species, which means restoring the diversity, abundance, and behavior of native animals and plants and halting the spread of invasive species.

Goal 3: Foster compatibility of the built and natural systems.

PROTOCOL FOR DISPUTE RESOLUTION

The GAO and Congress directed the task force to work with organizations and entities participating in the restoration effort to develop a decision-making process to resolve conflicts and accomplish the initiative in a timely and efficient manner. In response, the task force has commissioned the Florida Conflict Resolution Consortium and the US Institute for Environmental Conflict Resolution to develop a report due in early 2001 providing recommendations on building a more integrated system. This effort will clarify the task force roles in facilitating conflict resolution, propose possible components of an integrated system for dispute resolution, and recommend the next steps for task force action.

The specific, measurable work objectives and indicators of ecosystem health adopted by the task force will allow the task force to systematically track the progress of the restoration effort. Work has been underway in this reporting period to begin establishing the baselines and monitoring systems that will make this possible. Subsequent biennial reports will include information about the actual percent of accomplishment of various work objectives and indicators of ecosystem health since the last biennial report. In these earliest years of the restoration effort, these percentages are still very low and for some indicators are imperceptible. Consequently, this biennial report describes the recent accomplishments in qualitative, rather than quantitative, terms.

The remainder of this biennial report is organized around the progress made in accomplishing the three work goals established as part of the task force coordination strategy.

Goal 1 Accomplishments: Getting the Water Right

Federal and State Funding of the Comprehensive Everglades Restoration Plan

In July 1999 the *Comprehensive Everglades Restoration Plan* (CERP) was presented to Congress. Through the Water Resources Development Act of 2000 (WRDA 2000), Congress authorized a \$1.2 billion package of projects that will begin implementation of CERP. The initial authorization included six pilot projects, ten specific project features, and a programmatic authority through which smaller projects can be more quickly implemented. Authorization for the remaining features of the plan will be requested in subsequent Water Resources Development Act proposals beginning in 2002.

In January 2000 the State of Florida committed to providing \$1.25 billion of state resources over the next 10 years for Everglades restoration. This equates to more than \$100 million annually to be matched by an additional \$100 million from South Florida resources for a total of \$200 million each year. In addition, the state has created the Everglades Restoration Reserve Fund to help build reserves for restoration.

Pilot Project Implementation: Project management plans for the Lake Okeechobee and the Western Hillsboro aquifer storage and recovery pilot projects were well underway by the end of FY 2000, and WRDA 2000 authorized a third project management plan for the Caloosahatchee ASR Pilot Project. Aquifer storage and recovery (ASR) is a significant water resource component of CERP. ASR involves the injection of freshwater into a confined brackish aquifer during times when supply exceeds demand (wet season), and recovering it during times when there is a supply deficit (dry season). ASR components represent one-fifth of the total CERP cost. The pilot projects will address technical and regulatory uncertainties and demonstrate the viability of storing partially treated surface water or groundwater in the brackish Floridan aquifer for subsequent recovery. Pilot project efforts will be supplemented by a proposed regional study that will address additional questions raised by the ASR Issue Team, including critical pressure for rock fracturing, characterization of regional hydrogeology, and regional changes in head and flow. The project management plans for the Lake Okeechobee and the Western Hillsboro ASR Pilot Projects will be completed in February 2001. The Caloosahatchee project management plan will be completed in Fall 2001.

Water Quality Concerns: All of the participants in CERP recognize that many uncertainties are associated with implementing the plan and that projects may need to be added, deleted, or modified as these uncertainties are resolved. GAO has reported that additional water quality projects, in particular, may be needed and could increase the cost of implementing CERP. The state government has primary responsibility for achieving water quality standards in Florida. As the state identifies additional projects to improve water quality, the Corps of Engineers will evaluate whether the projects are essential to the successful implementation of CERP and whether the federal government should participate in them and share their costs. The participants have agreed that future project authorization proposals will reflect the cumulative changes to CERP in terms of projects and costs and indicate the progress being made toward implementing CERP.

Update on Ongoing Projects Predating CERP

Kissimmee River Restoration Project: The Kissimmee River Restoration Project, authorized in WRDA 1992, is under construction. The project, which is being jointly implemented and cost-shared by the SFWMD and the Corps of Engineers, will restore over 40 square miles of river/floodplain ecosystem including 43 miles of meandering river channel and 27,000 acres of wetlands. To date, over one mile of the C-38 canal has been backfilled, with both the backfilled canal and degraded spoil mounds graded to historic floodplain elevations. A quarter-mile-long section of river channel has been recarved and linked to remnant river channels on the east and west sides of the backfilled canal, thereby restoring flow through more than eight miles of river channel. In addition, the S65B water control structure and boat lock were demolished in June 2000.

The reestablishment of flow resulting from these efforts has begun to restore geomorphic attributes (physical features such as sandbars). Wetland vegetation, particularly broadleaf marsh species and buttonbush, is rapidly expanding on the reflooded floodplain. Recent observations indicate that the reconstructed section of river channel has received increased use by wading bird species, particularly snowy egrets, white ibis, tricolored herons, wood

storks, and black crowned night herons. Other notable bird observations in this region include a peregrine falcon, a roseate spoonbill, and a whooping crane.

Everglades Construction Project: In 1999 and 2000, the SFWMD completed construction on three additional stormwater treatment areas (STA-1 West, STA-2, and STA-5), bringing the total effective treatment area in operation to over 18,000 acres in four STAs. Following construction, a start-up process was initiated that included inundation of the areas to target depths and establishment of desired vegetation. Due to exceptional phosphorus removal performance observed in the prototype Everglades Nutrient Removal Project, portions of the new STAs are being managed for submerged aquatic vegetation; the remainder is being managed for cattails and other emergent vegetation. The phosphorus removal performance of the STAs has exceeded expectations, with discharges from STA-1W, STA-2, and STA-6 consistently below 30 parts per billion (ppb). Although still considered a young wetland system, STA-5 has been able to reduce inflow concentrations of over 300 ppb to below 50 ppb. Construction is set to begin on the largest STA, STA-3/4 within the next few months. Under the management of the Corps of Engineers, construction began in May 2000 on STA-1 East.

Over the last year, the SFWMD continued small-scale research on several advanced treatment technologies that will be utilized to lower phosphorus to achieve the long-term Everglades standard. Some of the key technologies evaluated include submerged aquatic vegetation, periphyton-based STAs, chemical treatment, and optimization of the STAs.

Critical Projects: The Florida Keys Carrying Capacity Study is underway. Project cooperative agreements for eight additional projects (all authorized under WRDA 1996) were executed in January 2000. Progress on these projects is as follows:

- East Coast Canal Structures: Plans and specifications completed.
- Western C-11 Basin Water Quality Treatment: Plans and specifications underway.
- Tamiami Trail Culverts: Design 90 percent completed.
- Seminole Big Cypress Reservation Water Conservation Plan: Data collection underway.
- Southern CREW Addition/Imperial River Flowway: Real estate acquisition and home removal underway.
- Lake Okeechobee Water Retention/Phosphorus Removal: Real estate acquisition underway for the stormwater treatment areas.
- Ten Mile Creek Water Preservation Area: Plans and specifications underway.
- Lake Trafford Restoration: Plans and specifications underway; boring underway to confirm depth of the material in the lake bottom.

Modified Water Deliveries to the Everglades National Park Project: In June 1999 the Corps of Engineers initiated a *Supplemental Environmental Impact Statement* (SEIS) to review its project plans for the 8.5 Square Mile Area, a very difficult and controversial component of the Modified Water Deliveries to the Everglades National Park Project. This project is funded from the Construction Account managed by the National Park Service and the Department of the Interior and is designed to restore more natural hydropatterns in Water Conservation Area 3 (WCA-3) and Shark River Slough. This will be accomplished by

December 2003 through removal and modification of existing levees and canals, along with construction of new water control structures and pump stations. The 8.5 Square Mile Area is a flood-prone residential area on the eastern edge of the project. In June 2000 the Governing Board of the SFWMD and the local sponsor of the project recommended to the Corps that it adopt Alternative 6D—a modified canal and levee alternative—as the federal project. Work is underway on an accelerated schedule to complete sufficient project features to allow hydropattern restoration by December 2003.

Goal 2 Accomplishments: Restoring, Preserving, and Protecting Natural Habitats and Species

State and federal agencies have already acquired 4.7 million acres of land for ecosystem restoration purposes (4.55 million acres for habitat and 0.15 million acres for water storage). As of September 1999, the state alone had acquired 3.2 million acres of habitat conservation land in South Florida at a cost of \$1 billion.

Habitat Acquisition

Calendar years 1999 and 2000 saw the acquisition of 299,505 acres at a price of \$495.8 million. The lands were purchased with funding from the Farm Bill, the Florida P-2000 Program and Conservation and Recreation Lands (CARL) Program, the Land and Water Conservation Fund (LWCF) and other federal, state, regional, and local sources.

**Land Acquisition Expenditures Summary
Calendar Years 1999-2000**

Funding Source	Amount (\$ millions)	Acres
Farm Bill 1996*	\$178.3	75,102
P-2000/CARL/SOR **	\$213.7	207,913
LWCF*** (SFWMD)	\$103.8	16,490

* Includes Talisman acquisition completed in 3/99.

** Both CARL and SOR projects are currently primarily funded by P-2000 funds and will be funded over the next ten years by Florida Forever funds. Florida Forever is a ten-year continuation of the P-2000 Program and will raise approximately \$3 billion (\$300 million per year) over the next ten-year period.

*** Includes Barry Groves acquisition completed in 10/00.

One highlight of the past two years has been the acquisition of the majority of the Southern Golden Gate Estates. To date, the Florida Department of Environmental Protection has acquired a total of 41,605 acres (project size 57,200 acres) of sensitive cypress, wet prairie, pine and hardwood hammock, and swamp communities in south central Collier County at a cost of \$52,613,478 using state and federal (Farm Bill) funds.

In April 2000 GAO reported that a land acquisition plan was needed to identify and prioritize the additional lands needed to achieve the restoration goals. The restoration strategy submitted by the task force in July 2000 lists the specific land acquisition projects with a primary purpose of restoring, preserving, and protecting natural habitats (goal 2), along with a schedule for their implementation. Additional land acquisition proposals are included as part of larger projects with the primary purpose of restoring more natural water quantity and quality (goal 1). Detailed project sheets for all of these projects, included in the strategy document, identify responsible agencies, estimated costs, and projected start and completion dates. The GAO report highlights the importance of acquiring as much land as possible, and quickly, because undeveloped land in South Florida is becoming increasingly scarce and costly.

Highlights of Habitat Management

Multi-Species/Ecosystem Recovery Implementation Team: In November 1999 a Multi-Species/Ecosystem Recovery Implementation Team (MERIT) was appointed with the purpose of overseeing the implementation of the *South Florida Multi-Species Recovery Plan*. MERIT includes 36 members representing federal, state, and local governmental agencies, two tribal governments, academia, industry, and the private sector. The focus of MERIT is on developing an implementation plan to prioritize the recovery and restoration actions identified in the recovery plan, and on recommending and funding on-the-ground recovery and restoration activities. The first of several planned subteams was appointed to develop a spatially explicit population model for the Florida panther in South Florida. This effort, as with other subteam efforts, will be integrated into the overarching conservation strategy for all of the listed species in South Florida.

Exotic Species Quarantine Facility: Congress approved the funding for the Ft. Lauderdale Invasive Plant Quarantine Facility. Invasive exotic plants and animals pose a significant threat to ecosystem restoration without direct and large-scale actions to manage them. The request for proposals (RFP) for construction of the quarantine facility was published in the *Commerce Business Daily* in December 2000. Contractor bids are due by January 31, 2001, and contractor selection is scheduled for early February 2001. Groundbreaking will be determined after contractor selection.

Florida spends more than \$87 million each year on exotic plant control.
--

Damage (1999) by weevil to mature melaleuca tree. Damage was severe enough to prevent tree from flowering.

Melaleuca Control Program: The fourth revision and update of the *Melaleuca Management Plan for Florida* was recently completed. The efforts of many agencies as directed through this comprehensive plan have prioritized the expenditure of over \$24 million and removed almost 70 million melaleuca plants (over 100,000 acres) from the Everglades Protection Area. This program was implemented with integrated strategies and long-term systemwide approaches that included the development of biological control agents. Since the release of the first insect, the melaleuca snout beetle (*Oxyops vitiosa*), their populations have increased enormously and in several of the release sites beetle

populations have had dramatic effects on the melaleuca.

Goal 3 Accomplishments: Fostering Compatibility of the Built and Natural Systems

Data Compilation and Analysis

South Florida Ecosystem Restoration Task Force Assessment Report: The Strategic Planning Team of the task force spent eighteen months canvassing South Florida governmental entities and nongovernmental organizations for a common vision of their desired future. The team reviewed hundreds of planning, visioning, and other efforts linked to achieving an improved quality of life for the citizens of South Florida, seeking specifically to (1) identify the particular interests and concerns of the many federal, state, tribal, and local participants in the restoration effort and the extent to which those interests and concerns could be synthesized into a shared vision and goals, and (2) identify major problems, if any, that would have to be overcome to ensure the effectiveness of this unprecedented multigovernmental ecosystem restoration effort.

The finding that the majority of all the participants in this process share similar goals was important information for the task force charged with coordinating the restoration effort. This information formed the basis for articulating a shared vision and goals for the entire South Florida ecosystem. The other major finding was the broadly shared belief that achieving a common vision and common goals for a sustainable South Florida will require improved coordinating of complex issues across jurisdictional boundaries.

Sustainable Agriculture Report: The working group's Sustainable Agriculture Task Team developed a report that details current conditions, concerns, and recommendations related to the conversion of agricultural lands to other land uses. Some 150,000 acres of productive agricultural land statewide are converted to other land uses each year. Growth pressures, rising property values and taxes, and other economic challenges to the agricultural industry

have frequently resulted in the development of agricultural lands that could otherwise provide lands needed to sustain the state's water resources, wildlife, open space, and environment. Task force member agencies can use the information in the report to help sustain agriculture.

Governor's Commission on Growth: In July 2000 Governor Jeb Bush created a Growth Management Study Commission to review Florida's current system of managing growth. The twenty-three-member commission is tasked with assessing the roles and responsibilities of the Department of Community Affairs and other state, regional, and local government entities. Issues to be discussed include local government comprehensive planning processes, citizen participation, private property rights, and viable agricultural economies. The commission will also focus on ways to improve intergovernmental coordination and streamline the review process. Five subcommittees have been assigned to study the following specific areas: state, regional, and local roles; infrastructure; citizen involvement; rural policy; and urban revitalization. The commission will present its findings and legislative recommendations to Florida's president of the senate, speaker of the house, and governor by February 15, 2001.

Flood Control and Water Supply

Flood Control: Severe flooding occurred within areas of Miami-Dade County as a result of Hurricane Irene in October 1999 and intense rainfall in October 2000. In response to the October 2000 flood, the executive director of the SFWMD appointed a Recovery Task Force under the auspices of the Emergency Operations Center to develop a list of proposed flood mitigation projects for the impacted areas of Miami-Dade County. The task force, comprised of SFWMD staff with expertise in engineering, geographic information systems (GIS), emergency management, operations, planning, and local flooding issues reviewed previous recommendations contained in Miami-Dade County, SFWMD, and Corps of Engineers reports, and recommended that mitigation projects should be considered on a basin-wide basis and include improvements to both the primary and secondary wastewater conveyance systems. Although none of the recommendations are designed to "flood-proof" the basins in which they are constructed, the projects should provide for increased primary system conveyance, which will then allow flood mitigation benefits from secondary system improvements in local communities.

Water Supply Projects: A regional water supply plan with a 20-year planning horizon was completed for each of the four SFWMD regional water supply planning areas: Lower East Coast, Upper East Coast, Kissimmee Valley, and Lower West Coast. A regional water supply planning advisory committee composed of representatives of all interest groups was convened for each planning region to assist in plan development. The goal of each plan is to meet the water supply needs of the region during a 1:10 year drought without causing harm to the environment. These plans contain recommendations for water resource and water supply development projects to achieve the goal. Funding and implementation schedules for the projects are included in the plans. All plans will be updated every five years.

The *Lower East Coast Water Supply Plan* is the most complex plan and has the most extensive environmental, economic, and social implications. After nine years of work this

plan was adopted by the district's Governing Board in May 2000. This planning effort was closely coordinated with development of the *Comprehensive Everglades Restoration Plan*.

Strengthened Public Outreach

CERP Outreach: The Corps of Engineers and SFWMD coordinated an intensive public involvement process during the development of CERP. A public involvement program was developed that was inclusive of all interests and concerns and balanced the sometimes-competing interests of the diverse region. Public involvement activities ranged from workshops, focus group meetings, educational and technical briefings, presentations to interested parties, public meetings, fact sheets, and newsletters, to having the results of alternative plan formulation efforts available on a web site for comment back to CERP planning team.

More than 1,500 people attended 12 public meetings in the fall of 1998 to comment on the draft CERP. Comments touched on most aspects of the complex restoration plan. Eleven meetings were held in South Florida from November 2 to December 1, and a final meeting was held in Washington, D.C., on December 8.

Public/Private Partnership between the Task Force and the Museum of Discovery and Science: On September 30, 1999, the Museum of Discovery and Science and the South Florida Ecosystem Restoration Task Force struck a historic partnership agreement to foster public understanding of the complexities and values of South Florida ecosystem restoration. The agreement was part of the task force's public outreach strategy to form public/private partnerships to acquire expert assistance in disseminating useful and engaging information to the public. The partnership was desired by both the task force and the museum, which has demonstrated success for two decades in educating the public and has demonstrated success in outreach, inclusion, and environmental education of urban, minority, and underserved communities. The Museum of Discovery and Science has the highest visitation of all museums in the state, more than 500,000 people annually, including more than 75,000 children. The museum runs several successful educational programs for schoolchildren, teachers, and the public at large and collaborates with museums worldwide in research, collections, program development, and exhibits. Collaborative work began this year on ideas and concepts that will be used to develop museum programs, exhibits, and special events related to South Florida ecosystem restoration. Additional venues will also be created to inform the public about the relevance of the many restoration efforts and the importance of a sustainable environment, economy, and society to the quality of life in Florida.

Agency Coordination and Public Outreach for the Tortugas Marine Ecological Reserve: Widespread government and public support for the creation of the largest marine ecological reserve in this hemisphere was gained through an intensive agency coordination and public outreach effort. The Tortugas region in the Straits of Florida has near-pristine marine resources, including one of the best-developed tropical coral reef systems on the continent. It is the epicenter of marine productivity for the region. This vast system has recently come under assault from inappropriate fishing practices and other public use. Ensuring its long-term protection and appropriate public use will require cooperation among multiple and overlapping jurisdictions, including the U.S. Departments of Commerce and

Interior and the State of Florida. In 2000 the managers of Florida Keys National Marine Sanctuary and Dry Tortugas National Park drafted coordinated plans for resource protection and public use. While the two managing agencies (the National Oceanic and Atmospheric Administration and the National Park Service) have distinctly different missions, they share common goals for Tortugas ecosystem health. By coordinating science, planning, and public outreach, and through collaboration with state agencies, the coordinated management of a vast area in the Tortugas region has been ensured.

WHAT'S NEXT?

In July 2000 the Department of the Interior submitted the task force's *Strategy for the Restoration of the South Florida Ecosystem* to Congress. The strategy document describes the more than 200 federal, state, tribal, and local programs designed to restore and sustain the imperiled South Florida ecosystem, and it provides the information needed to coordinate the restoration effort.

The specific, measurable work objectives and indicators of ecosystem health adopted by the task force are contained in that document. They will allow the task force to systematically track the progress of the restoration effort. Work has been underway in this reporting period to begin establishing the baselines and monitoring systems that will make this possible. Subsequent biennial reports will include information about the actual percent of accomplishment of various work objectives and indicators of ecosystem health since the last biennial report. For more information, see the discussion in the "Accomplishments" section on the *Strategy for Restoration of the South Florida Ecosystem*. That document is available by contacting the task force office, or on the web at <http://www.sfrestore.org>.

**TASK FORCE WORKING GROUP MEMBERS
FY 1999 - 2000**

Charles (Chuck) Aller

Florida Department of Agriculture and
Consumer Affairs

Ernest (Ernie) Barnett

Florida Department of Environmental Protection

G. Ronnie Best

U.S. Geological Survey

Mark Bradford

Bureau of Indian Affairs

Bradford E. (Brad) Brown

National Marine Fisheries Service

Billy D. Causey

Florida Keys National Marine Sanctuary

Wayne E. Daltry

Southwest Florida Regional Planning Council

Carol E. A. Degraffenreidt

U.S. Attorney's Office

Frank M. Duke

Palm Beach County Planning Department

Truman Eugene (Gene) Duncan

Miccosukee Tribe of Indians of Florida

Gary Evink

Florida Department of Transportation

Frank Finch

South Florida Water Management District

Stephen Forsythe

U. S. Fish and Wildlife Service

George Hadley

Federal Highway Administration

Richard Harvey

U.S. Environmental Protection Agency

Aaron Higer

U.S. Geological Survey

Ronald D. Jones

Florida International University

Kristina B. Katsaros

National Oceanic and Atmospheric
Administration

Toy Keller

Florida Department of Community Affairs

Neal McAiley

U.S. Department of Justice

Col. Joe R. Miller

U.S. Army Corps of Engineers

Mary Ann Poole

Florida Fish and Wildlife Conservation
Commission

Fred Rapach

Palm Beach County Water Utilities Department

Terry Rice

Miccosukee Tribe of Indians of Florida

Richard G. (Dick) Ring

Everglades National Park

Richard (Rick) Smith

Office of the Governor of Florida

Ron Smola

U.S. Natural Resources Conservation Service

Steve Somerville

Broward County Department of Planning and
Environmental Protection

Craig D. Tepper

Seminole Tribe of Florida

Vacant

State of Florida Local Government
Representative

Special Advisors

Bonnie Kranzer

Governor's Commission for the Everglades

Terrence "Rock" Salt

South Florida Ecosystem Restoration Task Force
